Introduction

- You are a middle man in the widget market.
- Your job is to buy widgets from widget producer companies and sell them to the widget consumer companies.
- Each widget consumer company has an open request for one widget for day, until some end date, and a price at which it is willing to buy the widgets.
- On the other hand each widget producer has a producer company has a start date at which it can start delivering widgets and a price at which it will deliver each widget.

Approach

- The first line of input contains two integers m and n ($1 \leq m, n \leq 500\,000$) denoting the number of producer and consumer companies in the market, respectively.
- It is followed by m lines, the i th of which contains two integers p_i and d_i ($1 \leq p_i, d_i \leq 10^9$), the price producer sells one widget and the day on which the first widget will be available from this company.

- It is followed by m lines, the i th of which contains two integers p_i and d_i ($1 \leq p_i$, $d_i \leq 10^9$), the price (in dollars) at which the i th producer sells one widget and the day on which the first widget will be available from this company.

Learnings

- Lists in python
- Gitlab
- latex,mictex,texmaker

Challenges

- faced problems while:
- Installing all the required packages for windows
- taking input from the user
- checking the condition of prices and dates simultaneously
- pushing files into git repository

References

- <https://docs.python.org>
- ACM ICPC 2017 world finals website
